Summary

Preface	7
1. Measures of Occurrence	11
1.1. Introduction	11
1.2. Prevalence	12
1.3. Incidence	13
1.4. Practical issues	16
1.5. Practical examples	16
References	22
2. Measures of Association	23
2.1. Relative risk	23
2.2. Risk difference	25
2.3. Other measures of attributable risk	26
2.4. Practical examples	28
References	35
3. Controlling for Confounding	37
3.1. What is confounding in epidemiology?	37
3.2. Controlling for confounding factors	38
3.3. How to control for confounding factors	39
3.4. Practical examples	42
References	52
4. Cross-Sectional Studies	53
4.1. Introduction	53
4.2. Performing a cross-sectional study	55
4.3. A practical example	56
References	66

5. Cohort Studies	67
5.1. What is a cohort study?	67
5.2. Why do we need a cohort study?	68
5.3. The eligibility criteria	68
5.4. The structure of a cohort study	69
5.5. Censoring	70
5.6. The statistical analysis in a cohort study	70
5.7. Practical examples	71
References	84
6. Experimental Studies	87
6.1. What is a sample experimental study?	87
6.2. Why do we need an experimental study?	88
6.3. The eligibility criteria	88
6.4. The randomisation process	89
6.5. The blinding	90
6.6. The structure of an experimental study	90
6.7. The statistical analysis in an experimental study	94
6.8. Practical examples	95
References	100
7. Temporal Trend Analysis	101
7.1. Introduction	101
7.2. Basic principles of temporal trend analysis	105
7.3. Practical examples	112
References	116
8. The Surveillance of Sexually Transmitted Infections: the Theory and the Practice	119
8.1. Introduction	119
8.2. Surveillance of sexually transmitted infections in the third millennium	120
8.3. Attributes of a STI surveillance system	122
8.4. Universal versus sentinel surveillance systems	127
8.5. How to perform STI surveillance	128
8.6. Data management and analysis	134
8.7. Practical exercises for analysing a dataset of STIs	135
References	156
9. Systematic Reviews and Meta-Analysis of Clinical Trials	159
9.1. What is a systematic review? What is a meta-analysis?	159
9.2. Why do we need systematic reviews and meta-analyses?	160
9.3. Practical steps of a meta-analysis	165

9.4. A practical example of a meta-analysis of RCTs.....	174
References.....	202
10. Meta-Analysis of Observational Studies.....	207
10.1. Introduction.....	207
10.2. Practical example.....	209
10.3. Worked examples.....	211
References.....	230
11. Genetic Epidemiology.....	231
11.1. Key concepts of genetic epidemiology.....	231
11.2. A practical example: the “candidate gene approach”	234
References.....	246
12. Analysis of Cost Data Using Bootstrap Technique	249
12.1. Introduction.....	249
12.2. Basic principles of the bootstrap method	250
12.3. Bootstrap standard normal confidence interval	251
12.4. Percentile method confidence interval	251
12.5. Bias corrected and accelerated (BCa) confidence interval	252
12.6. Application to example.....	252
References.....	259
13. Sensitivity, Specificity, and ROC Curves	261
13.1. Study introduction	261
13.2. Sensitivity, specificity, and predictive value	262
13.3. Basic principles of ROC curves.....	264
13.4. Use of ROC analysis for comparison	273
References.....	277
14. Measures of Central Tendency and Dispersion.....	279
14.1. Introduction.....	279
14.2. Measures of central tendency.....	279
14.3. Measures of dispersion	282
14.4. Practical exercise	286
References.....	288
15. Sample Size Calculations.....	289
15.1. What is a sample size and why do we need a sample?	289
15.2. Steps of a sample size calculation.....	290
References.....	302
16. Representation of Data	303
16.1. Introduction	303

16.2. Representation of qualitative variables	304
16.3. Representation of quantitative variables	314
References	324
17. Running Multiple Regression With Quantitative and Qualitative Variables With R	325
17.1. Introduction	325
17.2. The regression model with quantitative and qualitative variables.....	326
17.3. Practical example: multiple regression with 2 qualitative variables.....	331
References	347
18. Methods for Assessing Normality of Quantitative Variables.....	349
18.1. Introduction	349
18.2. Definition of normality	349
18.3. Parametric and nonparametric statistics	351
18.4. How to verify normality of data	351
18.5. Practical examples.....	353
References	359
19. Quality of Life Evaluation	361
19.1. Quality of life in the general population	361
19.2. Quality of life in the clinical setting.....	372
References	380
Appendix. Algorithm to create the SF-36 scales.....	382
20. Disability Adjusted Life Years (DALY) Summary Measure of Population Health	389
20.1. Introduction	389
20.2. Disability adjusted life year (DALY): the concept and its uses	390
20.3. Method for DALY estimation used in the serbian burden of disease study	390
20.4. Practical example: calculation of DALY for colorectal cancer, Serbia, 2000.....	395
Acknowledgments	397
References	398

Preface

When this book was conceived, as a discussion among members of the section of Public Health Epidemiology of the European Public Health Associations (EUPHA), the main idea was to describe not only theory, but above all how to use the available software for epidemiologic and statistical data analysis.

In the era of Evidence Based Medicine, health professionals are required to fully understand design, analysis and interpretation of the results of research. Furthermore, they should be able to assess the needs of their communities and respond accordingly. To achieve these goals, one needs to be familiar with the basic concepts of epidemiology and biostatistics.

But epidemiology is more than “the study of.” Its application and practice are essential to address public health issues.

So, the purpose of the book is to give the reader either the theory concerning specific aspects of technical disciplines as epidemiology and biostatistics, and in the mean time to give the opportunity of replicating under guidance the analysis done by each chapter’s author and already published in a given research article. The idea is to use the available software for epidemiologic and statistical data analysis, that each reader can download freely from the Internet.

Concerning the way in which the purpose of the book is to be achieved, it is important to underline that each chapter will present one or more specific examples on how to perform an epidemiological or statistical data analysis. The single chapter will give the reader the possibility of conducting an epidemiological or a statistical analysis, using a step by step approach. In other words, the reader will be able to do the analysis following the detailed description of the commands to use and the figures that represent a picture of the software command and/or output.

Why do we believe the book is needed?

The answer is mainly of technical reason. Up to now, many books concerning epidemiology and biostatistics are available, but no one could give practical examples using different freely available software. This book will use software such as Epi Info, Episheet, Simcalc, StatCalc, RevMan, that are downloadable from the web, and could cover most arguments concerning the two disciplines. In selected cases, we will make examples using commercial statistical software, such as Stata and SPSS.

The reader will be interested in this book because he/she will find a resolution of an epidemiological/biostatistical problem with practical example and a guide to use the software in a very detailed and efficient way.

Have you ever been interested in performing an epidemiological data analysis, but you thought to be not able to?

Have you ever been in trouble in making a statistical analysis, because you considered statistics a matter of statisticians only?

Applied Epidemiology and Biostatistics is the answer to you.

Questions as following will find an answer:

- How to perform a multiple logistic regression using your own data?
- How to calculate the 95% confidence intervals of that odds ratio?
- How to perform a meta-analysis of papers of your interest?
- How to make graphs for your report?
- How to make a ROC curve or control for a possible confounding?
- How to calculate the sample size needed for the clinical trial?

This is a manual designed for using software, that are freely downloadable from the web, and could cover most arguments concerning the two disciplines, epidemiology and biostatistics. In selected cases, examples will use commercial statistical packages.

Who is the best reader of this book?

Considering that epidemiology can be seen as the study of factors affecting the health and illness of a certain population, and the Biostatistics is one of the main pillar of the research, in our intention this manual will have as principle possible targets the following:

- Public Health practitioners (professionals, researchers).
- Clinicians (researchers).

- Health Managers (professionals, researchers).
- Teachers of Epidemiology.
- Teachers of Biostatistics.

Finally, I would like to thank all the contributors to this manual. Without their support and suggestions, it would have been impossible to achieve this goal.

Now, do you want to start?

Let's make Epidemiology and Biostatistics together!

Giuseppe La Torre

Instructions for Downloading

To download the software and databases described in this book, you need to:

- access the website <http://download.edizioniseed.it>
- access the “Download area” and
- type the code -----
